CUSTOMER JOURNEY MAP

Project: EV Market Analysis Dashboard using Tableau Public

Date	16 October 2026	**Team ID**	To be filled by team
Project Name	EV Market Analysis Dashboard	**Maximum Marks**	2 Marks

Primary customer: EV Market Strategy Director / Automotive Business Intelligence Manager / Sustainable Mobility Research Analyst.

Journey goal: Use a Tableau dashboard to understand EV sales, compare manufacturers and categories, explore battery technologies, and make evidence-based decisions.

Journey area	Stage 1: Define the question	Stage 2: Explore the dashboard	Stage 3: Decide and share
Actions	Identifies a business question, such as which manufacturer sells the most EVs.	Opens dashboard, applies filters, compares charts and checks KPIs.	Uses findings to recommend a product focus, market opportunity, or research direction.
Touchpoints	Project brief, dataset, Excel/CSV field list, stakeholder questions.	Tableau Public dashboard, KPI cards, bar charts, scatter plot, filters and tooltips.	Dashboard link, presentation, report, or stakeholder discussion.
Customer thoughts	"Which metrics will help answer my question?" "Can I trust the data?"	"Which category leads?" "How do battery types and range compare?" "What changes when I filter?"	"What is the strongest evidence?" "What limitations should I mention?"
Customer feelings	Curious, but may feel uncertain about the large dataset.	More confident when charts are clear; frustrated if labels, filters, or values are confusing.	Confident if insights are understandable and transparent; cautious if data is incomplete.
Process ownership	Project team defines the questions and confirms the required dataset fields.	Dashboard developer prepares data, checks calculations, builds visuals, and tests filters.	Analyst or business user interprets results; project team shares the dashboard and explains limitations.
Opportunities to improve	Prioritize clear questions and confirm which fields exist before building charts.	Use consistent colors, readable titles, useful filters, null checks, and sensible aggregations.	Add concise insight notes, show units, document missing values, and avoid claiming the dataset represents the whole global market.

Success measure: A user can find a relevant comparison quickly, understand what each chart measures, apply filters without confusion, and explain at least one evidence-based insight with its data limitation.
